

# The effect of Starter™ on field grown sugar beet yield, sugar content, and profit, 2009-2010

Baicor's Starter™ was applied to Idaho sugar beet fields at a rate of one gallon per acre during markout. The Starter™ treatment was compared to the Grower's Standard Practice (GSP). In every trial the GSP plus Starter™ treatment produced a greater yield than the GSP alone. This translates into increased profit at little cost for a grower. In addition, the application of Starter™ produced beets with greater sugar content in all but one field site.
