

## The effect of Starter™ on field grown potatoes, 2012

Baicor's Starter™ was applied to Idaho potato fields at a rate of one gallon per acre during markout. The Starter™ treatment was compared to the Grower's Standard Practice (GSP). In every trial the GSP plus Starter™ treatment produced a greater yield than the GSP alone. This translates into increased profit at little cost for a grower. In addition, the application of Starter™ produced a greater yield of higher grade potatoes (more 1's than 2's) than the GSP alone. Yield was measured as cwt/acre or the number of 100 pound bags produced per acre.
