

Baicor[®] Products

Product Storage and Mixing Recommendations

The following is general information regarding Baicor[®] product usage, mixing and storage recommendations. Follow label instructions for all applications, compatibility, and mixing directions.

- Baicor recommends performing a jar compatibility test prior to mixing products with other products.
- Mixing of products: ensure that the spray tank is clean and without chemical residues from previous sprays. Fill tank 2/3 full with water and add one product at a time and stir well before adding next product. Add rest of water while agitating.
- When mixing other products with Baicors products, it is recommended to stir or agitate while mixing products together and during application.
- Follow all labels directions.
- Store Baicor products out of direct sunlight for extended periods of time.
- Storage of bulk products is best suited for original manufacturing containers. If required, storage in a polypropylene storage tank with polypropylene fittings is recommended. Metal storage tanks and fittings are not recommended for long term storage of products.
- During cold weather, store products above 55° F.
- When using a foliar product, Baicor recommends the use of a surfactant such as Foliar Friend, to decrease drop size and enhance the uptake of foliar products.
- If you have any questions or concerns, please contact Baicor at 435-752-2475 or visit our web site at www.baicor.com.
